

STUDENT EXAMINATION SCORE PREDICTION USING ACADEMIC HISTORY AND STUDY HABIT ANALYTICS

Problem Statement:

Educational institutions continuously monitor student performance to improve academic outcomes and provide timely support. Traditional evaluation methods mainly depend on previous examination results and often fail to consider important factors such as study habits, attendance, assignment completion, and learning behavior. This limits the ability of educators to identify students who may require additional academic assistance before final examinations.

The proposed solution is a **Student Examination Score Prediction System** that predicts examination scores using academic history and study habit analytics. The system provides a centralized platform where faculty members and administrators can monitor student performance through a secure and user-friendly interface.

By integrating machine learning algorithms, the system analyzes attendance records, previous examination scores, assignment performance, study hours, classroom participation, and learning behavior to predict future examination results. It identifies students who may be at academic risk, generates predictive reports, and provides analytical dashboards that help faculty deliver personalized guidance and improve learning outcomes.

The system is secure, scalable, and suitable for schools, colleges, and universities.

Ultimately, this project delivers a modern and intelligent academic prediction solution that improves examination score forecasting, enables early intervention, supports data-driven educational planning, and enhances overall student academic performance.
